PUBLIC-SECTOR DECISION BRIEF / OCTOBER 2026

Shipping Route Intelligence Executive Summary

Nassau Candy Distributor | Educational case study

8,549	8,549	8,245	4.29 d
Dispatches	Raw >365 days	Future dated	Exploratory only

Decision: withhold performance claims. All original dispatch intervals exceed one year. Neither the source data nor the experimental adjustment validates real shipping or delivery performance.

The asset

A tested Streamlit dashboard with factory-state route rankings, US state heatmap, volume-based hotspot candidates, service-tier comparisons, filters, and order-level timelines. Original timestamps remain inspectable.

The central evidence gap

10,194 product lines consolidate into 8,549 dispatches; source orders occur in 2024-2025, but ship dates span 2026-2030. There are three 365-day-spaced offset bands. Removing these on an **unverified sensitivity basis** gives 4.29 days on average and 24.6% above five days. These residuals are **not actual delivery KPIs**.

Exploratory mode pattern

Service tier	Dispatches	Adjusted average
Same Day	442	0.38 days
First Class	1,312	2.55 days
Second Class	1,653	3.54 days
Standard Class	5,142	5.32 days

Required public-sector safeguards

Timeline	Action required
0-30 days	Reconcile raw ERP shipment events, true facilities, time zones and carrier proof-of-delivery; validate the three hypothesized offsets.
30-60 days	Add delivery timestamps, freight cost, promised dates, actual origins, distance and service-mode controls.
60-90 days	Pilot governed lane monitoring; report actual fulfillment separately from transit and carrier on-time performance.

Scope note: The five Wonka-named factories are assignment assumptions; US maps exclude Canadian destinations. Cost in the source means manufacturing cost, not freight charges.
